Executive Summary

This report presents the findings of an Impact Studio project conducted at Sciences Po between October 2025 and May 2026 in collaboration with MUV, an Italian sustainable-mobility startup. The project assessed the conditions under which MUV could enter the French market, building on the regulatory, market, and stakeholder analysis presented in the Intermediate Report (January 2026). It concludes that the strategic gap to be addressed in France is not technological but relational: the ecosystem possesses mature infrastructure and regulation but lacks the engagement layer through which institutional ambitions can be translated into sustained user behavior.

On this basis, we converged on a dual-track market entry strategy. The first track consisted of structured institutional dialogue with five French cities, Perpignan, Bourges, Auxerre, Rennes, and Bordeaux, currently in active conversation regarding the implementation of MUV, with Perpignan the most advanced and closest to a formal pilot agreement. The second track consisted of a pilot tournament running from 23 March to 10 May 2026 within the Sciences Po Impact Studio community, accompanied by a curated communication ecosystem developed in Figma.

1. Introduction

MUV is an Italian sustainable-mobility startup that has developed a gamified application designed to encourage more sustainable mobility behaviors. The platform transforms everyday journeys into a collective game in which users earn points, join challenges, and compete individually or as part of a team. MUV's underlying ambition is not to deliver yet another mobility tracking tool but to act on the social and motivational dimensions of mobility choices, treating behavioral change as a design problem rather than a purely informational or infrastructural one.

Figure 1. MUV's value proposition: gamified sustainable mobility, with an average 32% reduction in CO₂ emissions among active users

While the platform has been involved in occasional French initiatives, notably a mobility challenge with Université de Montpellier Paul-Valéry, its presence in France remains partial and fragmented. The Impact Studio mandate was conceived to address this gap by clarifying the conditions under which a more structured and scalable French deployment could be envisaged.

2. Context Study: Synthesis of the Exploration

2.1. Strategic relevance of the French market

For MUV, France represents a geographically proximate and institutionally comparable market to Italy. The two countries share a substantial common regulatory base at the European level, particularly in mobility policy, sustainability objectives, and data protection, which reduces the regulatory friction associated with cross-border expansion. France also presents cultural and behavioral similarities, especially in southern regions where mobility practices, urban density, and modal choices show structural parallels with the Italian context.

Beyond proximity, the French context is strategically attractive because of the regulatory weight given to employer mobility planning. Organizations with more than fifty employees on the same site are required to address mobility within the broader framework of the *Plan de Mobilité Employeur*, and listed companies are increasingly subject to non-financial reporting obligations under the Corporate Sustainability Reporting Directive (CSRD), particularly Scope 3 emissions which include employee commuting. These constraints generate a structural demand for tools capable of producing reliable, auditable mobility data, and they create a clear regulatory anchor for engagement-oriented solutions like MUV.

2.2. Regulatory and institutional framework

The deployment of a gamified mobility solution in France is shaped by a dense regulatory architecture structured at both European and national levels. At the European level, the General Data Protection Regulation (GDPR) imposes strict requirements regarding lawful processing, user consent, and individual rights. The ePrivacy Directive complements this framework by regulating tracking technologies. The CSRD extends non-financial reporting obligations to a growing number of companies and explicitly includes Scope 3 emissions, creating a regulatory incentive for organizations to measure and structure mobility-related data.

At the French national level, the *Commission Nationale de l'Informatique et des Libertés* (CNIL) plays a central role in enforcing GDPR, often applying a strict interpretation of consent and data retention rules. The *Loi d'Orientation des Mobilités* (LOM) consolidates national mobility governance and emphasizes data sharing and interoperability. Employers above the threshold of fifty employees are required to implement *Plans de Mobilité Employeur*, and the *Loi Climat et Résilience* reinforces the integration of sustainability considerations into corporate practices. Regulatory convergence at the European level facilitates cross-border expansion, but national implementation introduces substantive operational constraints that require patient navigation rather than rapid scaling.

2.3. Market and competitive landscape

The French sustainable-mobility market is highly institutionalized and structured predominantly around B2B and B2G use cases. Across the ecosystem, a clear divide separates infrastructure-oriented actors, Mobility-as-a-Service platforms (Maas), mobility-benefits providers, compliance and reporting tools, from engagement-oriented solutions built around challenges, rewards, and gamification. Few players successfully bridge system-level integration and sustained behavioral engagement, and this fragmentation is one of the most important structural features of the market.

Direct competitors to MUV include platforms that combine mobility tracking, engagement mechanisms, and impact reporting, such as Squadeasy, Mobeelity, Moovance, and Geovelo. Their positioning differs significantly as some prioritize playful gamification that drives short-term engagement but lacks structural integration, and others focus on institutional MaaS or data infrastructure, offering credibility and scale but limited motivational appeal. Indirect competitors include infrastructure platforms such as Betterway, Worklife, and regional MaaS applications like Île-de-France Mobilités, which distribute mobility benefits and ensure regulatory compliance but operate largely in the background of users' daily lives. Therefore, there is a strategic gap in the French ecosystem for solutions positioned as an engagement and motivation layer, that can connect existing systems, data, and incentives with human behavior.

Figure 2. MUV's three product lines, each addressing a different segment of the engagement layer the French market currently lacks: MUV2WORK (employers), MUV2CITY (municipalities), and MUV2APPS (integration via SDK). Source: MUV.

2.4. Stakeholder ecosystem and governance logic

The stakeholder analysis carried out across the case studies of Perpignan and Orléans, and subsequently extended to Bourges, Auxerre, Rennes, and Bordeaux, highlighted a recurring governance pattern. At the core of each ecosystem are institutional stakeholders responsible for the organization, financing, and regulation of mobility systems: municipalities, mobility

departments, intercommunal authorities, and public-transport authorities. These actors hold formal decision-making power and act as gatekeepers for any large-scale deployment, with priorities driven by policy objectives, regulatory compliance, and operational feasibility.

The most important insight that emerged from this analysis is the structural separation between governance and engagement. Decision-making power is concentrated among institutional actors, while behavioral change is expected from users who have limited agency over system design. Many mobility initiatives consequently struggle to translate policy objectives into sustained participation. For MUV, this configuration carries two implications. First, successful deployment requires early and close collaboration with direct institutional stakeholders. Second, long-term impact depends on the ability to activate peripheral actors and users, transforming them from passive beneficiaries into active participants.

2.5. The MUV solution and the strategic gap

MUV's solution architecture is designed precisely to occupy the engagement layer that the French ecosystem lacks. It articulates four components: a Survey module for collecting baseline mobility data, a Dashboard with AI-assisted analytics for monitoring Scope 3 indicators, the MUV Game itself for active engagement, and a Report module for producing sustainability reports compliant with European standards. This integrated structure is what distinguishes MUV from purely playful gamification tools on the one hand and purely infrastructural reporting platforms on the other.

Figure 3. The MUV solution: an integrated chain from data collection through engagement to certified reporting. Source: MUV.

Our findings during the exploratory phase converge on a single structural diagnosis, that the French mobility landscape is characterized by an increasing division between the maturity of its institutional and infrastructural layer and the underdevelopment of its behavioral and engagement layer. Public authorities and private actors have invested significantly in

infrastructure, regulation, and incentives, yet the tools capable of mobilizing individual users, sustaining their engagement over time, and translating policy ambitions into lived practices remain scarce, fragmented, and short-lived.

Infrastructure enables sustainable mobility choices but does not motivate them. Regulation creates obligations but rarely produces enthusiasm. Incentives reduce friction but cannot, on their own, build habits. Within this gap, MUV's strategic opportunity lies less in offering another mobility-tracking tool than in operating as an intermediary layer between systems and behaviors, between policy and practice.

3. Lines of Thought: Strategic Pathways Considered

Tension 1: Standalone application vs. integration layer

The first tension concerns the position MUV should occupy in users' digital ecosystems. Operating as a standalone application preserves direct contact with users, gives MUV full control over the experience, and supports the cultivation of a recognizable brand. However, this model is increasingly difficult to sustain in the French context as users are saturated with mobility, productivity, and lifestyle applications, and institutional actors increasingly prefer tools that integrate into existing ecosystems. The opposite extreme, operating purely as an integration layer with no direct user-facing presence, would dissolve MUV's distinctive contribution. The strategic question is therefore how to combine a direct experiential layer for committed users with embedded capabilities.

Tension 2: B2G institutional anchoring vs. B2B market activation

The second tension concerns the choice of entry channel. The B2G route benefits from strong legitimacy effects and places MUV directly within the policy frameworks (LOM, Climat et Résilience, SUMP) that structure the French market. Its disadvantages are lengthy institutional procurement cycle, decentralized decision-making, and the constraints of political timing. The B2B avenue is anchored in the obligations applicable to French employers (Plan de Mobilité Employeur, Forfait Mobilités Durables, CSRD reporting), and aligns MUV's value proposition with concrete compliance needs but requires either a direct sales capacity or a network of intermediaries that MUV does not yet possess in France. Our working hypothesis was that B2G institutional anchoring should serve as the legitimating frame within which B2B opportunities can subsequently be developed, particularly for an Italian startup seeking to establish itself in a market where institutional embedding is a precondition for credibility.

Tension 3: Short-term activation vs. long-term habit formation

The third tension is that game-based mobility solutions in France are predominantly used as short-term activation tools that have limited retention over time. Once the challenge ends,

behavior reverts. MUV's strength lies in the intensity of the experiences it generates through tournaments, teams, and road to during the campaign window. Its limitation, in the French context, is the difficulty of converting these spikes into continuous engagement.

CO₂

From tensions to a dual-track hypothesis

The combined resolution of these three tensions led us to a dual-track hypothesis. Rather than selecting a single channel or model, our chosen solution articulates two complementary tracks designed to address different layers of the gap. The two tracks are designed to inform each other, where the institutional track produces the political and territorial conditions within which future deployments can scale, and the community pilot produces the operational and methodological evidence that institutional partners need to commit.

4. The Chosen Solution: A Dual-Track Market Entry Strategy

4.1. Overall logic of the dual-track approach

Our solution combines a territorial track, structured around dialogue with five French cities (Perpignan, Bourges, Auxerre, Rennes, and Bordeaux), and a community track, structured around a pilot tournament hosted within the Sciences Po Impact Studio community. Our aim was to demonstrate that MUV can credibly occupy the engagement layer that the French ecosystem currently lacks, and to do so in ways that are visibly compatible with the institutional and cultural specificities of the territories in which it seeks to operate.

4.2. Track A, Institutional anchoring through municipal partnerships

4.2.1. Selection logic and territorial profiles

The selection of the five cities was guided by the multi-criteria framework developed during the exploratory phase. The framework deliberately privileged mid-sized cities over the largest metropolitan agglomerations. Paris, Lyon, and Marseille offer scale and visibility, but their mobility ecosystems are dense, contested, and dominated by established actors. Mid-sized cities present a more favorable market given their mobility-governance frameworks are sufficiently mature to support experimentation, their decision-making circuits are shorter, and their need for visible engagement instruments is more acute. Each of the five cities was approached based on its own institutional configuration.

4.2.2. Perpignan: the most advanced dialogue

Perpignan represents the most advanced of the five conversations and the territory closest to a formal pilot agreement. The city's representative described Perpignan as a territory in a **d e l i b e r - a p e p h a s e c h o n** mobility as **only recently** become **S u s t a i n** a political priority, with a new municipal team taking the subject in hand approximately six years ago. Since then, the city has renewed its public-service delegation contract with significantly higher ambitions, reactivated a previously dormant cycling policy, allocated a substantial annual budget to cycling infrastructure, and begun expanding shared-mobility services. A MaaS application called Sankéo is scheduled for full deployment by the end of 2026.

The structural barrier identified by the city is not the supply of mobility services but the perception of those services. Despite the expanded offer, residents continue to picture the mobility landscape as it existed ten or fifteen years ago, and a deep cultural attachment to the **c a r** remains. The city explicitly framed **i t s** alternative mobility feel real, modern, and desirable. It is precisely within this framing that we identified gamified challenges as a strategically promising lever, particularly given Perpignan's strong local sport culture and the existing tradition of participatory events. The city's

representative explicitly noted that competition and game mechanics had not previously been considered as mobility-policy levers and reacted very positively to the proposition.

The principal constraint identified is political timing as the municipality is entering an election period, after which the mobilization of elected officials will be considerably harder. We have therefore prioritized Perpignan in the production of French-language materials and planned a follow-up exchange aligned with the city's internal validation timeline.

4.2.3. Bourges: aligning with Bourges 2028

The dialogue with Bourges is structured around the city's designation as European Capital of Culture for 2028. This designation provides a strategic opportunity of which any mobility intervention can be scoped. Bourges 2028 generates a series of mobility needs that map closely onto MUV's value proposition. The city is seeking a low-carbon visitor mobility model encouraging arrivals by train and movement by free buses, walking, and cycling between cultural venues. It anticipates peak-flow management challenges around opening weekends and seasonal launches. It is working toward an intermodal hub at the train station for the end of 2027, and it has committed to publishing a voluntary online carbon calculator, alongside an explicit interest in credible methods for quantifying event emissions and reductions.

Our framing of MUV's contribution articulates four levers: behavioral (gamified challenges and tournaments designed around venue-to-venue routes, embedded in the storytelling of Bourges 2028); impact-related (avoided CO₂e estimates capable of reinforcing the city's low-carbon narrative beyond a self-reported calculator); data-driven (aggregated mobility-usage insights that complement existing planning frameworks and support post-event legacy decisions); and operational (set-up of a dedicated Bourges community within the application, alongside a communication kit comprising QR codes, posters, banners, and an optional landing page). Bourges already uses GeoVelo for cycling tracking, and we explored with the city the feasibility of an API-level articulation in which cycling data continues to flow through GeoVelo while points, challenge participation, and impact reporting connect to MUV. This integration is technically plausible but requires a dedicated feasibility check. As with Perpignan, the city flagged an upcoming electoral period that will affect the rhythm of internal validation.

4.2.4. Auxerre: anchoring within an eco-district trajectory

Auxerre is currently undertaking a significant urban transformation focused on ecological transition, with its most emblematic project conceived as an eco-friendly neighborhood, with construction permits recently issued and full realization expected by 2030. The city's representative explicitly suggested that MUV's services would be more effective if deployed at the scale of the entire city rather than confined

to the new neighborhood, allowing Auxerre to begin producing measurable mobility-behavior effects immediately while the eco-district matures.

4.2.5. Rennes: a deferred but technically substantive exchange

Two technical themes structured the conversation with Rennes. The first concerns interoperability at the metropolis level, as the metropolis emphasized that its residents already use multiple mobility applications, making the addition of yet another standalone application a non-trivial barrier. The proposed collaboration is therefore to integrate with third-party services through Open APIs. When a partner application can certify a trip, MUV can process that data and award points without requiring the user to track the trip in MUV directly. As with Perpignan and Bourges, the principal obstacle to immediate progression is political as Rennes is in an election period, and decisions are deferred until the new leadership is established.

4.2.6. Bordeaux: an introductory contact

The exchange with Bordeaux is at the earliest stage of all five dialogues and consisted of a single introductory meeting. The city's profile remains strategically attractive since Bordeaux is a metropolitan environment with mature mobility governance, an active cycling culture, and a dense network of universities, employers, and cultural institutions that create multiple potential pilot anchors. The conversation has not yet produced sufficient substance to define a precise scope, and Bordeaux is therefore best understood, at this stage, as a maintained contact rather than as an active pilot prospect.

4.2.7. Cross-cutting observations

Through the various meetings, we have highlighted several observations. First, the political-timing constraint recurs across territories which explicitly raises upcoming election cycles as a factor shaping their capacity to commit. This is a structural feature of municipal decision-making in France, and any market entry plan needs to integrate it from the outset. Second, the diversity of strategic anchors across the five cities is striking: Perpignan frames the conversation around a perception gap, Bourges around a flagship cultural event, Auxerre around an eco-district trajectory, Rennes around interoperability and fidelity-system integration, Bordeaux too early to characterize. There is no single "Free but a layered ecosystem of territories with distinct framings, and any deployment strategy needs to be calibrated city by city.

4.3. Track B, Community pilot at Sciences Po

In parallel with the institutional dialogue, we launched a pilot tournament within the Sciences Po Impact Studio community. The is structured as a team-based competition organized around the existing professional and disciplinary affiliations of the Impact Studio cohort. Teams were formed based on the participating organizations and impact tracks, leveraging pre-existing

group identities to lower the social cost of participation. The choice of Sciences Po as a pilot environment is a strategic one as the institution offers a structured community, geographic concentration in central Paris, a strong cultural openness to sustainability discourse, and a population whose multimodal mobility patterns are well-aligned with MUV's tracking capabilities.

We retained a tournament format over a more open-ended challenge format, on the basis that the tournament's weekly match structure produces stronger engagement dynamics and clearer narrative momentum across the seven-week window. The figure below summarizes the formal distinction between the two formats and clarifies why the tournament format aligns with our pilot objectives.

Figure 4. The two principal MUV game dynamics: Challenges (individual or collaborative) versus Tournaments (weekly inter-team competitions with elimination stages). The Sciences Po pilot uses the Tournament format. Source: MUV.

The tournament's incentive structure combines collective and individual rewards. The winning team receives a one-month Vélib' V-Plus subscription, a curated Sciences Po Mobility Kit, and an official winner certificate signed by the MUV founders. The strongest individual player, designated as the Mobility Champion, receives a Vélib' One-Day Pass, signature Sciences Po merchandise, and an official MVP certificate. The choice of Vélib' as the principal external reward is deliberate as it links the experience of the tournament to a tangible mobility infrastructure and avoids the trap of purely symbolic rewards that fail to anchor behavioral change beyond the campaign window.

4.4. Communication design as a strategic methodology

The communication ecosystem surrounding the Sciences Po pilot is the most substantial methodological contribution of this final phase, and the one most directly transferable to MUV's subsequent French deployments. We approached communication not as a downstream

activity bolted onto an otherwise complete deployment, but as a strategic instrument capable of bridging the gap between the platform's intrinsic value proposition and the lived realities of its users. Every visual and textual choice was treated as a design object whose configuration directly conditions adoption, retention, and ultimately the perceived legitimacy of the platform within its host community.

All artefacts were produced and iterated within a shared Figma workspace, which has functioned simultaneously as a production environment, a collaborative interface with MUV, and an archival record of the design choices made over the course of the project.

Two newsletters, sent to the Sciences Po community in the run-up to and at the launch of the tournament, illustrate the methodology in concrete form.

Figure 5. Pre-launch newsletter (20 March 2026): introducing the tournament, framing the rewards, and announcing the league composition.

The pre-launch newsletter (Figure 5) introduces MUV by foregrounding its underlying logic (sustainable mobility reframed as competition) without overburdening the reader with technical detail. It frames the tournament as a collaborative initiative between the Impact Studio and MUV, anchoring its legitimacy within an institutional partnership, and it materializes the stakes

of participation through the explicit presentation of rewards and the listing of all participating teams, which activates pre-existing group identities and makes participation visible across the cohort.

Figure 6. Launch-day newsletter (23 March 2026): activating the tournament, providing onboarding instructions, and reaffirming the league composition.

The launch-day newsletter (Figure 6) shifts register from anticipation to activation. Its central function was operational aimed at converting passive interest into actual onboarding by reducing the cost of joining the tournament to a four-step sequence.

5. Conclusion

Key learnings

Several takeaways resulted from our engagement with the MUV team, and the strategic analysis of the market entry. Firstly, the structural shape of the French sustainable-mobility market is best understood as a layered architecture in which infrastructure, regulation, and incentives have matured significantly while the engagement and motivation layer remain comparatively underdeveloped. The strategic opportunity for new entrants lies in occupying this complementary position. The second takeaway concerns the role of communication design in mobility-behavior interventions as a primary lever, and investment in communication design should be treated as a precondition for product-market fit rather than deferred until afterwards. Finally, the relationship between foreign origin and institutional credibility faces challenges that are not primarily linguistic or technical but relational, and trust is constructed through patient, situated engagement with institutional interlocutors.

Appendix

A. Pre-launch newsletter, 20 March 2026

The artefact reproduced below was sent to the Sciences Po Impact Studio community on 20 March 2026, three days before the launch of the MUV pilot tournament.

Dear students,

We're excited to launch the Impact Studio Tournament in collaboration with MUV!

MUV is an Italian app that turns sustainable mobility into competition. Walking, cycling, and public transport all become part of a larger game, where users collect points, join challenges, and compete individually or as part of a team.

As part of Impact Studio — and as students in the programme ourselves — we've been working on MUV's entry into the French market. This tournament is one of the ways we are bringing that project to life within the Impact Studio community, through a dedicated league built around team spirit, leaderboard dynamics, and a shared challenge.

From 23 March to 10 May, teams will go head-to-head, earn points through the app, and move through the different stages of the tournament.

And because no competition is complete without something to win, both the top team and the strongest individual player will be rewarded at the end of the tournament.

WINNING TEAM

1-month Vélib' V-Plus subscription for Paris' bike-sharing system

Curated Sciences Po Mobility Kit designed for everyday movement

Official Winner Certificate signed by the MUV founders

MOBILITY CHAMPION

Vélib' One-Day Pass

Sciences Po signature merch

Official MVP Certificate

Joining the tournament is easy — simply sign up in the app, join the Impact Studio community, and select your team:

Global Banking Groups (BNP Paribas, BNP Paribas – Cardiff); Investment & Public Banking (Natixis Investment Managers, La Banque Postale); Luxury & Fashion (Kering, Hermès); Legal, Audit & Advisory (Herbert Smith Freehills, Wheddon, Mazars, Forvis Mazars); Consulting & Business Transformation (Newtones, Foreteam); Tech & Cybersecurity (ZenGate, Advens for People & Planet); Sustainable Mobility & Environmental Transition (MUV, Impact entrepreneur track – Biodiversity); Social Impact & Solidarity (SINGA, Groupe SOS Solidarités); Foundations & Ethical Economy (Fondation CMA CGM, Max Havelaar); Culture & Creative Institutions (Théâtre du Châtelet, Amandiers et CMBV); Impact entrepreneur track – Social Isolation; Entrepreneurship & Sustainable Innovation (Impact entrepreneur track – Cognity, Impact entrepreneur track – Food surplus); Impact Studio Professors & Staff.

STEP IN

Game on.
Join. Compete. Move.

See you on the leaderboard.
The Impact Studio x MUV Team

B. Launch-day newsletter, 23 March 2026

The artefact reproduced below was sent to the Sciences Po Impact Studio community on 23 March 2026, on the launch day of the tournament.

Dear students,

The Impact Studio Tournament on MUV starts today!

Teams are getting ready, the first points are about to be counted, and the leaderboard will begin to take shape from day one.

If you haven't joined yet, this is your moment to step in. It takes less than a minute, and once the tournament begins, every move will start to matter.

Getting started is simple:

- 1 Download the app
- 2 Create your account
- 3 Join your team
- 4 Start tracking your movements

Whether it's a short walk, a bike ride, or your daily commute, everything counts. Just don't forget to activate the app when using sustainable means of mobility so your points are recorded.

What matters is showing up, staying consistent, and helping your team move forward.

When joining the tournament, please make sure to choose your team according to the grouping below:

Global Banking Groups (BNP Paribas, BNP Paribas – Cardif); Investment & Public Banking (Natixis Investment Managers, La Banque Postale); Luxury & Fashion (Kering, Hermès); Legal, Audit & Advisory (Herbert Smith Freehills, Whaydon, Mirova; Forvis Mazars); Consulting & Business Transformation (Newtones, Foresteam); Tech & Cybersecurity (ZenGate, Advens for People & Planet); Sustainable Mobility & Environmental Transition (MUV, Impact entrepreneur track – Biodiversité); Social Impact & Solidarity (SINGA, Groupe SOS Solidarités); Foundations & Ethical Economy (Fondation CMA CGM, Max Havelaar); Culture & Creative Institutions (Théâtre du Châtelet, Amandiers et CMBV; Impact entrepreneur track – Social isolation); Entrepreneurship & Sustainable Innovation (Impact entrepreneur track – Cognity, Impact entrepreneur track – Food surplus); Impact Studio Professors & Staff.

STEP IN

Onwards,
The Impact Studio x MUV Team
